

## BAR SUPPORTED FULL DENTURE IMPLANT RETAINED REMOVABLE DENTURES

This option utilizes a thin bar that connects multiple implants; the denture is retained and supported by “snaps” on that bar. You would remove this denture to clean underneath, and it is very stable in your mouth when it snaps to place.

The advantage is that it is much easier to clean under the denture base; the disadvantage is that some patients do not like the feel of the bar in their mouth when the denture is removed.
